

SE Lab 3 - Component Modelling & Architectural Pattern Selection

Name: Selvaganesh Arunmozhi

SRN: PES2UG24CS451

Class: 5 H

Our system has three layers: interface (the apps), logic (booking, wellness, scheduling, anonymizing) and storage (the database). Each layer only talks to the one below it. The system is small, with only two users and a few features. Microservices would add too much complexity, so layered is easier to build and understand. Both the employee and therapist apps use the same Booking component. If booking rules change, we only update one place. Only the Anonymizer can see real employee identities. The therapist app can't reach the database directly, so therapists only ever see pseudo-IDs.
