

1. Requirements Table

Req ID	Type	Description	Priority	Acceptance Criteria (measurable pass/fail)	Rationale (short)	Comments (peer review)
FR-001	Functional	The system shall generate a unique anonymous pseudo-ID for every employee account at registration, and shall use only this pseudo-ID in all therapist-facing screens, booking records and session notes.	High	Pass: after registration the therapist dashboard and the booking record show only the pseudo-ID (e.g. EMP-7F2K). Fail: corporate email, employee ID or real name appears anywhere in therapist-visible data or booking metadata.	Anonymity is the single reason employees will trust the portal enough to use it.	Peer: "say where the ID is used, not just that it exists" - description updated.
FR-002	Functional	The system shall allow an employee to complete a stress self-assessment questionnaire and shall display a numeric stress score with a band (Low / Moderate / High) immediately after submission.	High	Pass: on submitting all questions, the score and its band appear on screen in the same session. Fail: no score is shown, or a score is shown without a band.	Employees need a self-check result before they can decide whether to book a session.	Peer: "add the band names" - done.
FR-003	Functional	The system shall allow an employee to book a confidential session by selecting an available slot from a licensed therapist's calendar, and shall mark that slot unavailable to all other employees once the booking is confirmed.	High	Pass: after a booking is confirmed, the same slot no longer appears in any other employee's search results. Fail: two employees are able to confirm the same slot (double booking).	This is the core service of the platform; everything else supports it.	Peer: "double booking case makes this testable" - kept.
FR-004	Functional	The system shall allow a licensed therapist to add, edit and delete their consultation slots, entered in the therapist's own local timezone.	High	Pass: a slot added by a therapist appears in the employee booking view, and an edited or deleted slot is reflected there within 1 minute. Fail: a deleted slot is still bookable by an employee.	No bookings can exist unless therapists can publish and correct their availability.	Peer: "1 minute is measurable, good".
FR-005	Functional	The system shall display a personal wellness dashboard showing the employee's stress scores from their last 6 assessments as a dated trend line, visible only to that employee.	Medium	Pass: an employee sees only their own past scores plotted in date order. Fail: the dashboard displays another employee's data, or shows no history after 2 or more assessments.	"Track personal wellness indicators" is a stated goal, but booking still works without it, so it is Medium.	Peer: "why Medium?" - reason added to rationale.
NFR-001	Nonfunctional (Performance & Security)	The appointment scheduler shall display every slot converted to the viewer's local timezone, and shall confirm a booking within 3 seconds while 500 employees are booking concurrently.	High	Pass: a slot published as 3:00 PM IST is shown as 11:30 AM CET to a Frankfurt therapist, AND a load test with 500 concurrent bookings gives a 95th-percentile confirmation time under 3 s. Fail: any incorrect conversion, or 95th percentile above 3 s.	Offices are in different countries - a wrong time means a missed therapy session.	Peer: "give one real conversion example" - IST/CET example added.
NFR-002	Nonfunctional (Security & Privacy)	The system shall store all session notes and assessment answers encrypted with AES-256, and shall not write any employee-identifying field into application or server logs.	High	Pass: direct inspection of the database shows ciphertext only, and a 24-hour log audit finds zero occurrences of corporate email or employee ID. Fail: notes stored in plain text, or any identifying field found in logs.	Mental-health data is highly sensitive; one leak would break employee trust.	Peer: "logs are an easy place to leak PII" - added the log clause.

2. Use Case Flow

Primary Actor: Corporate Employee

Secondary Actor: Licensed Therapist (receives the booking on their dashboard)

Goal: Reserve a confidential counseling slot without revealing the employee's real identity.

Trigger: The employee selects "Book a Session" from the portal home screen.

Includes: UC-09 Send Appointment Notification (always runs when a booking is confirmed)

Extended by: UC-10 Reschedule Session (optional, only if the employee later changes the time)

Preconditions

1. The employee is logged in with an active account and an assigned pseudo-ID (UC-01 has completed successfully).
2. At least one licensed therapist has published free slots (UC-04).
3. The therapist's licence has been verified by the Platform Administrator (UC-06).

Postconditions

1. A confirmed booking record exists, linked to the employee's pseudo-ID only - no corporate email or employee ID is stored on it.
2. The chosen slot is marked unavailable and disappears from every other employee's slot list.
3. The employee and the therapist have each received a confirmation showing the time in their own local timezone (NFR-001).

Main Success Scenario

1. Employee selects "Book a Session" on the home screen.
2. System displays the counseling categories (Stress, Anxiety, Work-Life Balance) and asks for a preferred date range.
3. Employee picks a category and a date range.
4. System fetches matching verified therapists and displays their free slots, converted to the employee's local timezone.
5. Employee selects one slot.
6. System shows a confirmation page with the date and time, the session mode (video / audio / chat) and the employee's pseudo-ID.
7. Employee confirms the booking.
8. System re-checks that the slot is still free and locks it.
9. System creates the booking record against the pseudo-ID.
10. System includes UC-09 Send Appointment Notification - a confirmation goes to the employee's masked inbox and to the therapist's dashboard.
11. System displays "Your session is confirmed" together with a booking reference.
12. Use case ends successfully.

Alternate Flow

8a. Slot taken by another employee while this employee was on the confirmation page

- 8a1. System detects at step 8 that the slot has just been locked by a different booking.
- 8a2. System displays "Sorry, that slot was just taken" and does not create a booking record.
- 8a3. System refreshes the slot list for the same therapist and the same date range.
- 8a4. If other slots are free, the flow returns to step 5. If none are free, the system offers the next available date and the flow returns to step 4.
- 8a5. If the employee cancels instead, the use case ends with no booking created and no notification sent.
